Guide To Future Day Trading

Futures Day trading is a process of buying and selling the future contracts. Good knowledge, discipline and experience are the three most important qualities that one must have to be a good future day trader. The market parameters like the tick size and the symbol depends a lot on the day to day specification of the future market. Being the active trading market, the future trading market has very high price and trading volume. Being regulations free makes future trading most preferable in US markets.

Good liquidity and price movement along with basic instruments are available in future markets. The fundamental instruments are currencies, stock indexes and commodities. Future trading can happen both in up and down direction, so if there is the chance that the market is going upwards then one can opt for the long trade and buys a contract and sells it while moving out. You should go for short trade if the market goes downward. In this you need to sell a contract for entering and for exiting you need to buy a contract.

The same technique is maintained for the multiple contracts, and you will also find that there are separate entries and exits followed in each contracts. The basic measure is that there must be the same number of entries and exits for the particular trading market. Trading at both sides is the biggest advantage of the future trading and from this the trades gains more profits. The topmost concern of the traders is the type of the trading not the direction.

The agricultural products like the wheat, coffee, fruit, cotton, rice, along with some commodities like FX, energy products and real estate are considered to be the main ingredients of the future trading system.

A few important future contract specifications are symbol, expiration date, exchange, and tick size and value. By combining the exchange, symbol, and expiration date together, you can understand the current market and contract. Tick size and value are a few of the elements that specify the price, profit, and loss potential of the market.

The validity period of future contracts is particular and when that period gets over the traders have to update the software for the next contract. Most the time these future contracts are valid for 3 months and are over in the month of March, June, September, and December. But some future trades expire much more frequently and you get full details of popular future trades in their market profiles.

Another advantage of future trading is the facility of not holding overnight and the traders get free from open position worries. In short period of time a lot of data about the future markets can be learnt.

Your future day trading ventures can only be successful, if you have patience and discipline. If you want to avoid big losses then you need to be fully prepared for day trading futures.

In closing, keep in mind a [futures day trading plan](#) will provide you with a base to beginning your investing career and is not an item that should be taken as a joke.
