# How To Practice A Roulette Strategy

A common mistake that people make when testing [roulette strategies](#) is that they play for real money straight away. There are several reasons as to why this is a bad idea, which I will now explain.

To begin with, always ensure that you understand the strategy that you are using before you bet real money with it. There are a lot of people that will begin to play without knowing what they are doing, as they will have just skimmed over it.

If you do this it will lead to a guaranteed failure so never just go rushing into it. Another mistake people make is playing for real when the strategy hasn't been tested or proven. If a new car has not been fully tested would you buy it?

Of course you wouldn't and roulette strategies should be no different, there are ways of testing them without risking money. You can either play [free roulette](#) or you could simply paper trade rather than place real bets.

Both of these are simple yet effective ways of testing different strategies. More often than not, you will find that the strategy that you were testing wasn't very good so you will be left with a sense of relief that you were playing for free.

The only time that you should play for real with a strategy is when you understand it fully and have tested it out. Remember though that you will never be guaranteed to win, don't be too shocked if you don't get lucky. You should however make sure that you will at least have some chance of winning.

It's also worth saying that it can be quite good fun playing roulette for free and testing different ideas. You're always safe in the knowledge that you aren't risking any money so it just allows you to sit back and enjoy the game and see what's working and what's not.
