Roulette Betting Systems - Are they Worthwhile

Since its creation in 18th century France, roulette has become one of the worlds most popular gambling games. Over the years literally hundreds of roulette systems have been created, promising players that they will give them some sort of advantage. Remember though, there is no roulette system in existence that can guarantee that you win. A roulette system can be useful, in fact most system players will do better than ordinary gamblers simply because it adds discipline to their betting. This can be especially useful when you [play roulette online when self discipline is especially important.](#)

Among the numerous roulette systems, variations of Martingale strategy are quite common and popular amongst roulette players. In this system the player doubles up the bet after each loss. The premise of the martingale system (and all its copies) is that if you keep doubling up your stake youll eventually win all your money back plus a profit.. Its a shame, but Im afraid that martingale actually has some serious problems. A very major one is that every single casino I know has a maximum stake limit, and this strategy means you can reach that limit very quickly. Theres another very popular system known as the Fibonacci betting system. With this strategy, the player calculates the bets according to the Fibonacci number sequence.

Andres Martinez, author and former editor of LA Times invented an interesting roulette gambling strategy which he named Dopey Experiment. In this experiment the player needs to divide his total amount of money for one session in 35 equal portions. Then he will bet the amount of each portion for the same number for 35 consecutive spins. If the ball lands on the number within 35 spins, the player gets back the original amount and can continue playing with house money.

Similar to Martingale system, there is another progression based roulette gambling strategy which is called Labouchere System. This system has a serial of number in a line which guides the player to fix the bet amount after a loss or win. This system is more flexible than Martingale system and it allows the player to make the initial bet on his own preference. A long run of series losses in the Martingale system can make the player reach the table limit and stop. However, the Labouchere system makes the bet size increase rapidly even if the losing sequence is interrupted by wins.

DAlembert system, another roulette gambling system is also known as montant et demonant and more popularly as pyramid system. The theory behind this system is a mathematical equilibrium theory. This system is generally applicable on even money bets such as red/black, odd/even and high/low. The pattern of this system is quite simple: add one unit following a loss and deduct one unit following a win. This roulette gambling system is fundamentally flawed as the underlying idea of this system is based on the gamblers fallacy that a win is more likely to be followed by a loss and vice versa.

There are too many of these systems misleading people online, worse some people actually buy them. However, be aware about such promises as there is simply no system that can ensure a win. Rather consider the system as a method of playing that may maximise your luck. If you want to test any of these systems make sure you use one of the free games that most casinos offer first, or try this [live roulette wheel which simulates the random number generators used by online roulette wheels. just click on the picture to spin the wheel.](#)
